

Classification Functions for Machine Learning

A Logic Synthesis Approach
to Data Mining and
Pattern Recognition

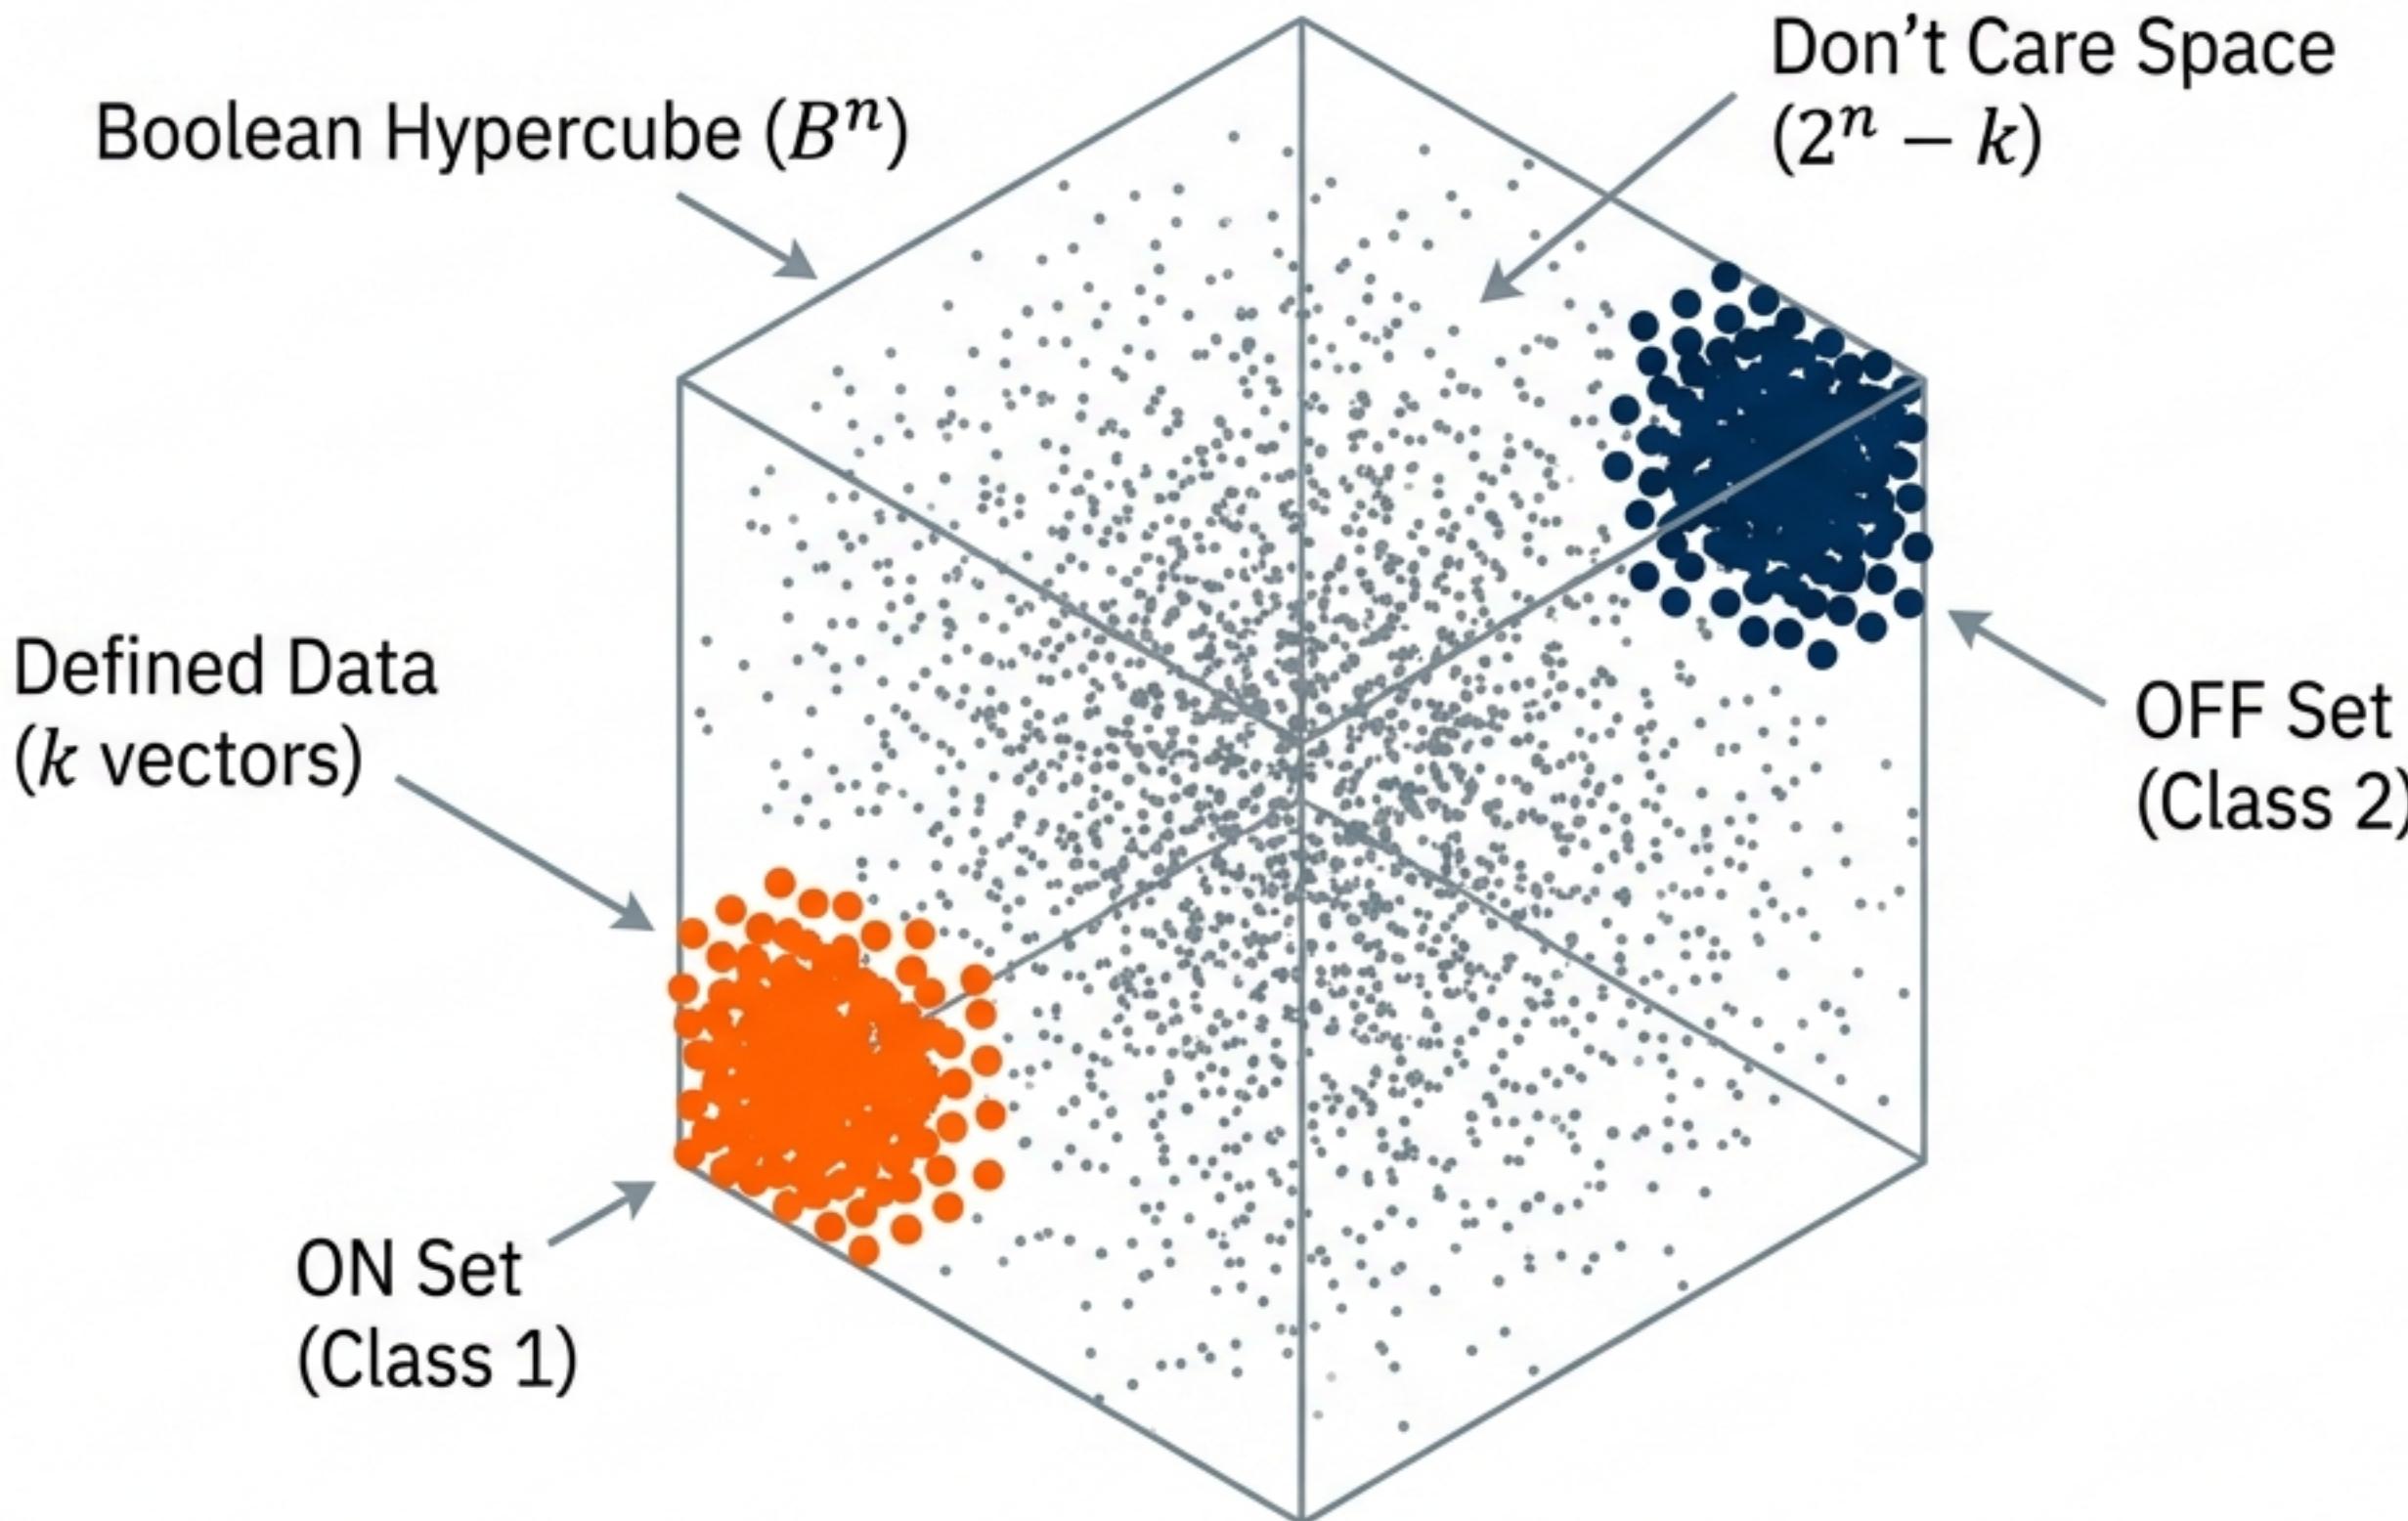

Based on the research of
Tsutomu Sasao | Meiji University, Japan

Trading Accuracy for Radical Hardware Simplicity

	Neural Networks (The Current Paradigm)	Logic Synthesis / SOP (The Proposed Solution)
Circuit Structure	 Multi-level threshold network	 AND-OR two-level structure
Learning Method	Backpropagation / SGD (Continuous)	Variable Reduction (Discrete)
Hardware Cost	High Power / Massive GPU Memory	Low Power / Compact LUTs
Interpretability	Black Box (Opaque)	White Box (Explicit Boolean Rules)
Generalization Strategy	High Accuracy, Weights-based	Lower Accuracy, Logic-based

Classification as a Partially Defined Function

$$f : D \rightarrow M$$

$D \subset B^n$
(Binary inputs)

$M = \{1, 2, \dots, m\}$
(Classes)

Key constraint:
Training size $k \ll 2^n$

The Objective: Minimization of Variables

Support Set S

x_1	x_2	x_3	x_4	f
0	0	1	0	0
0	0	1	1	0
0	1	0	0	1
0	1	0	1	1
1	0	1	0	0
1	0	1	1	0
1	1	0	0	1
1	1	0	1	1

If $F_i|_S \cap F_j|_S = \emptyset$, the reduced variables are sufficient.

Exact Minimization via Difference Vectors

Identify Essential Variables

Is unit vector e_i in the Difference Set?

Generate Minimal Difference Vectors

Calculate $d = a \oplus b$ for all pairs.

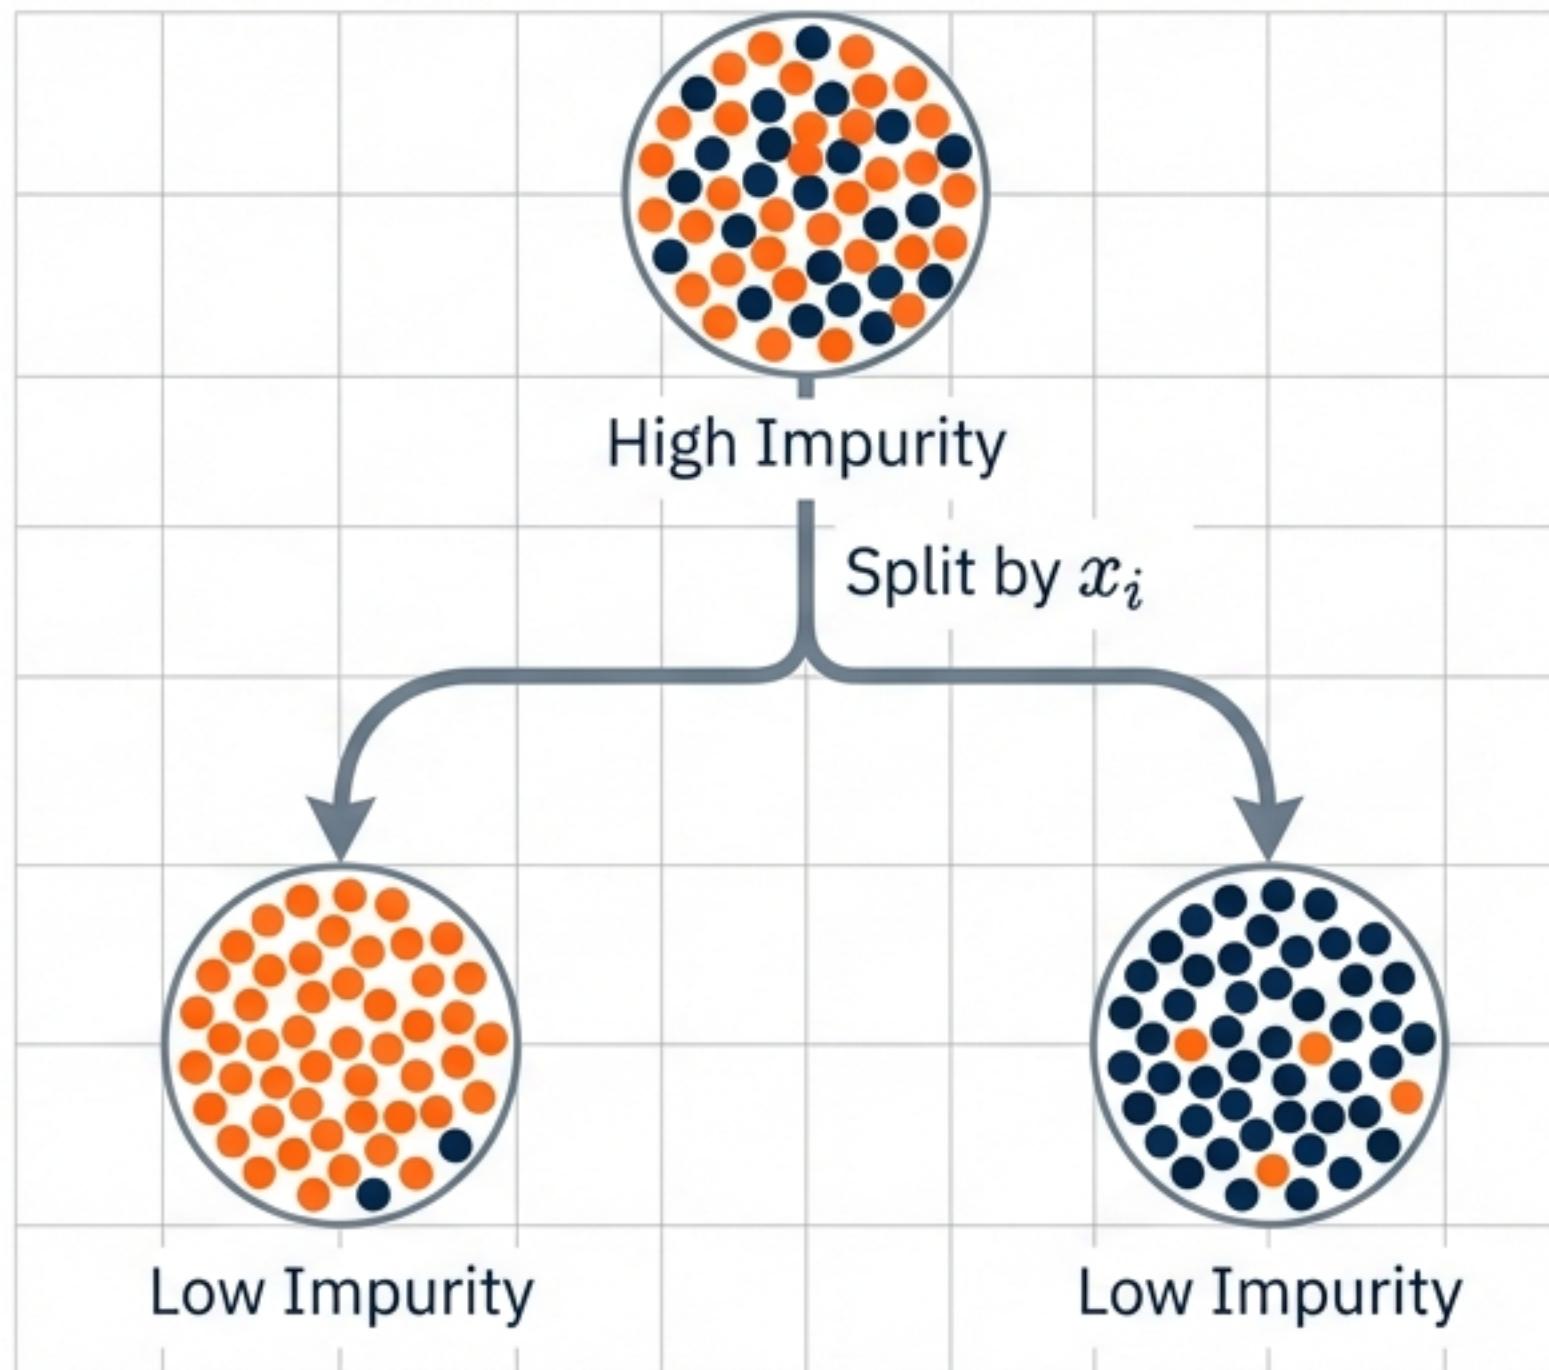

Solve Covering Problem

Find minimum support set S that covers all differences.

Difference Vector Definition:

- $\vec{d} = \vec{a} \oplus \vec{b}$
- Variable x_i is essential iff difference set contains e_i .

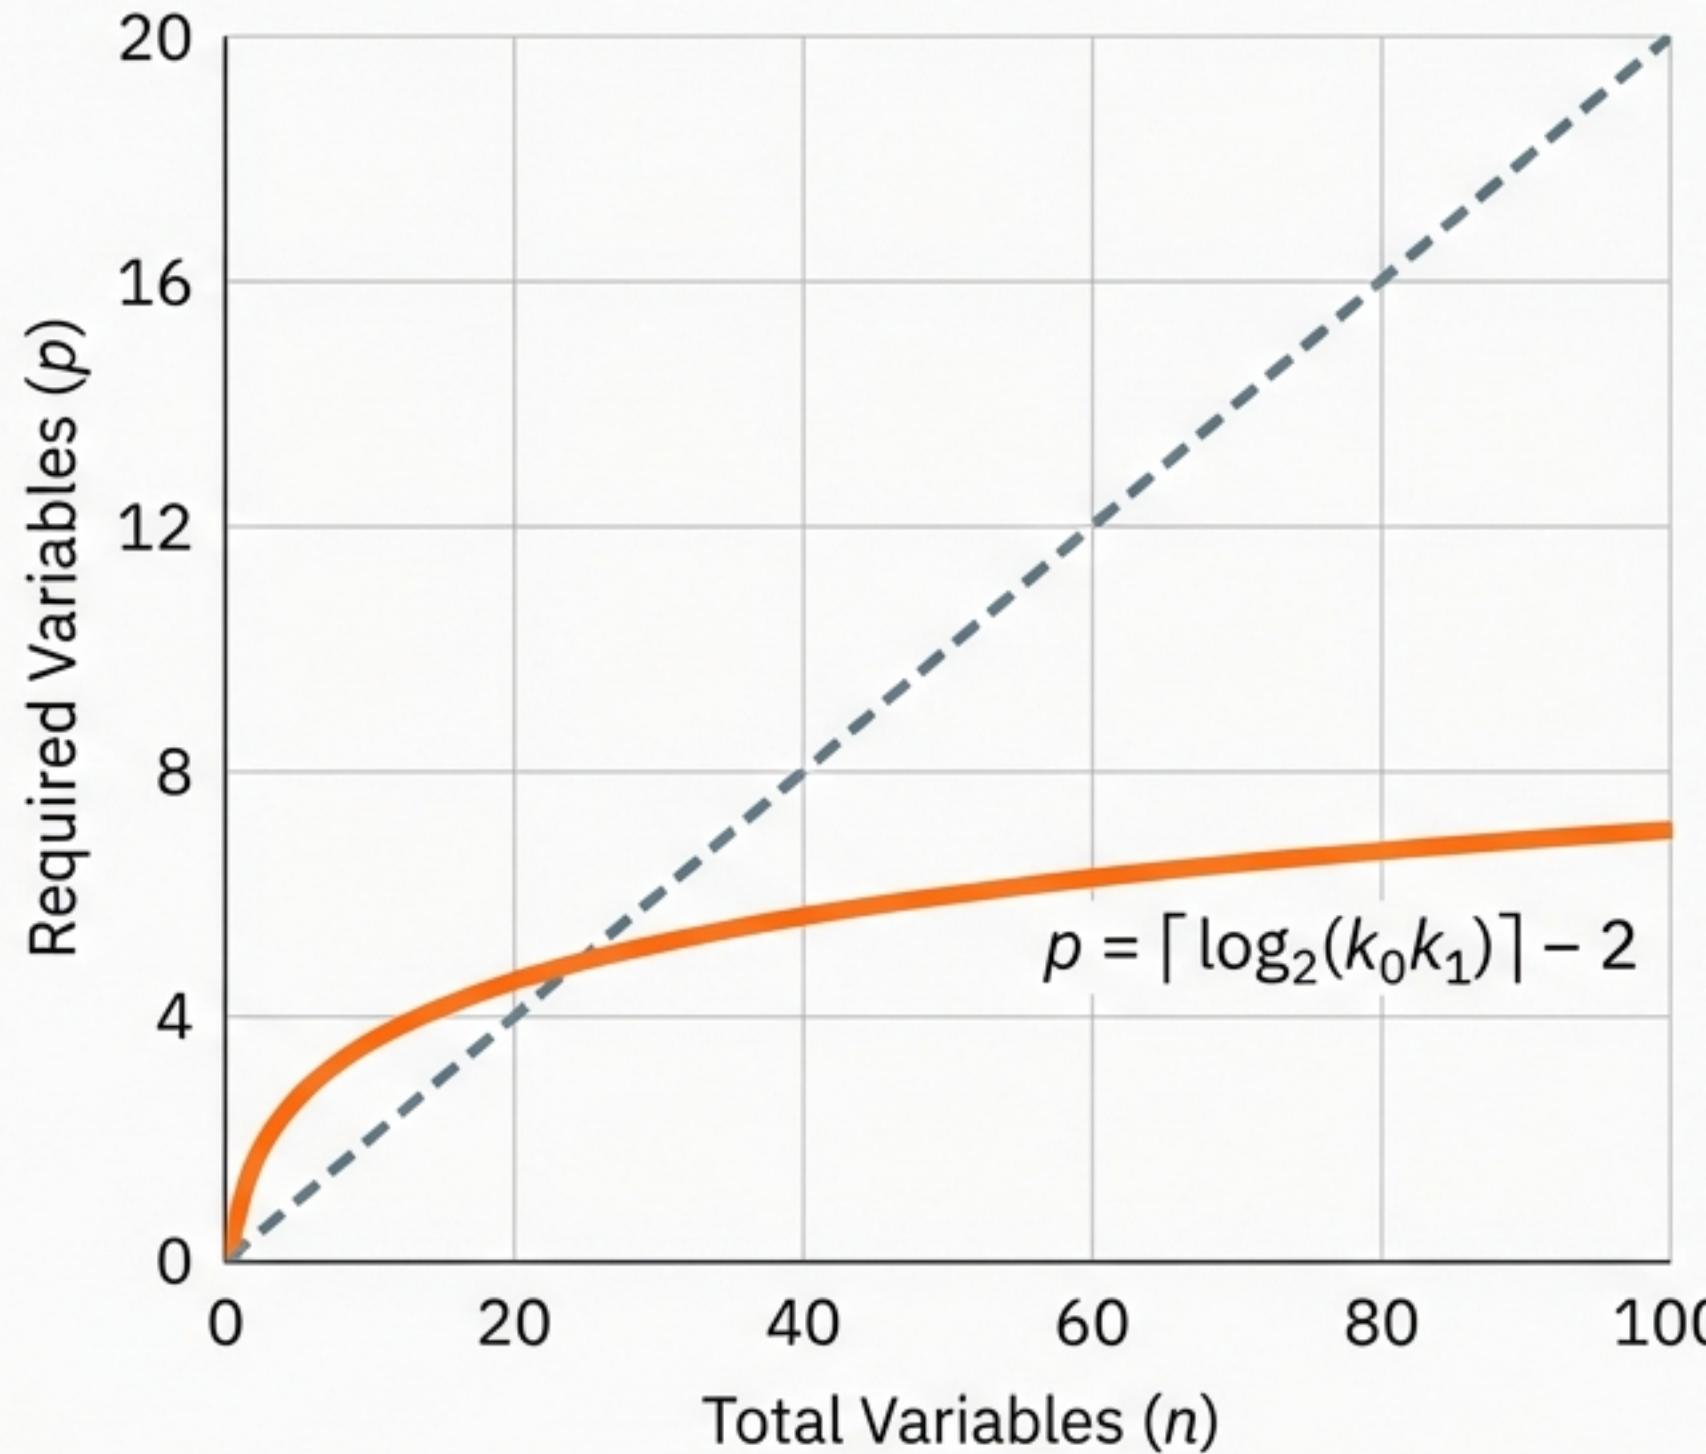

Heuristic Selection: The Impurity Measure

$$\mu(\vec{a}) = \sum \left[\text{Size}(j)^2 - \sum \text{Hist}(j, \text{Value})^2 \right]$$

Greedy Strategy: At each step, select variable x_i that minimizes μ .

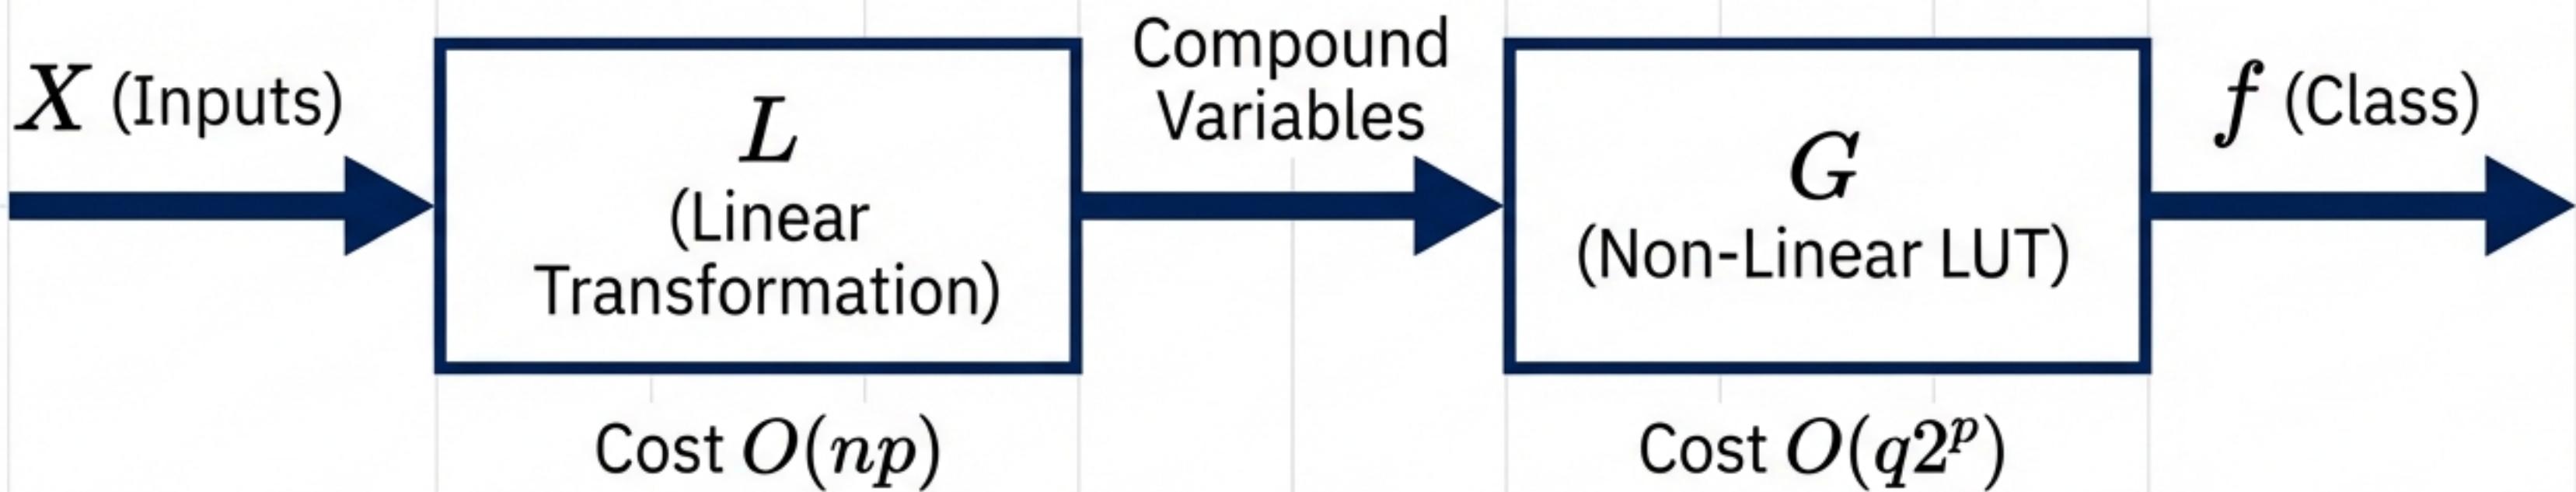

Statistical Bounds of Variable Reduction

The Parsimony Guarantee

For random functions, as $n \rightarrow \infty$, the probability of needing **needing** $> p$ variables approaches 0.

Handling Non-Linearity: Linear Decomposition

Solves the “Achilles Heel” (e.g., XOR functions) by shifting complexity to the linear block.

Generalization via Logic Minimization

Training Data

1			0	
		1	1	
1	1			
		0		

SOP Minimization

1			0	
		1	1	
1	1			1
		0		

Generalization

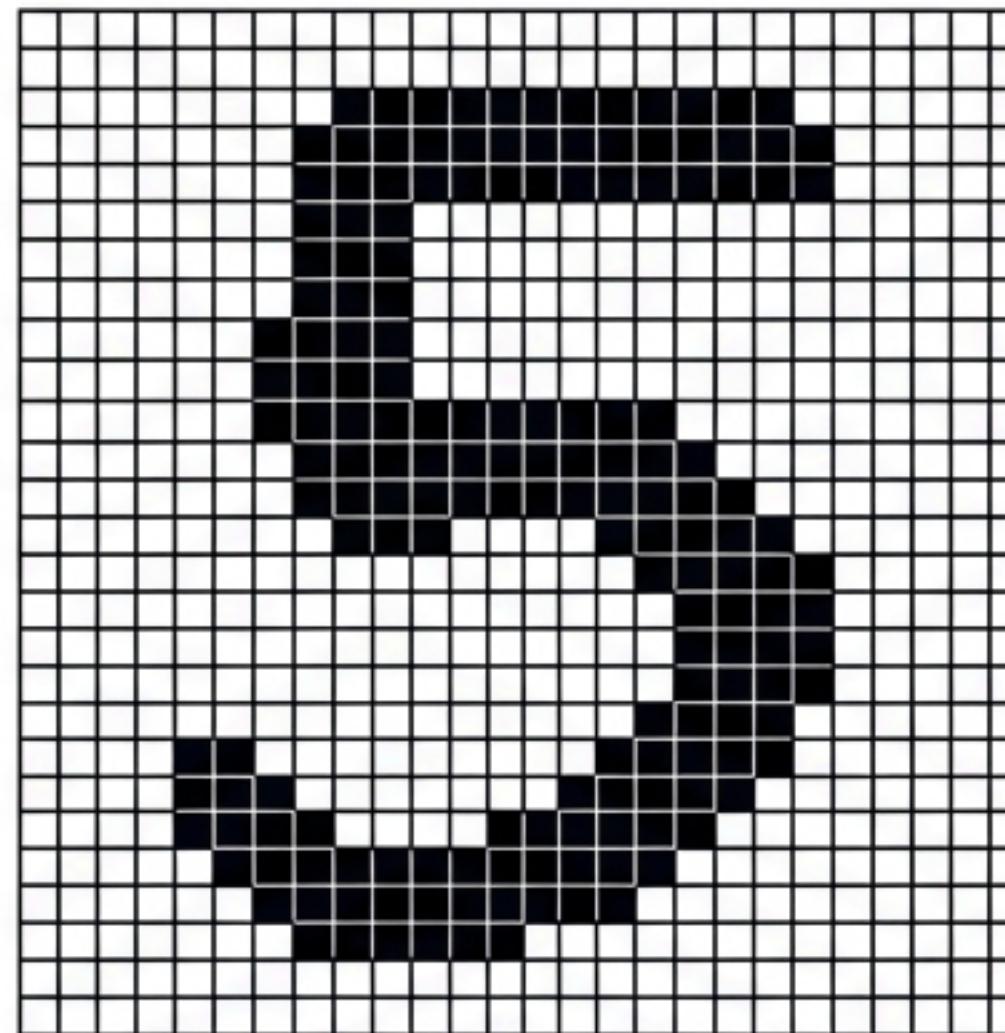

1			0	
		1	1	
1	1			1
		0		

Minimizing the logic naturally “fills in” the Don’t Care space with the simplest explanation.

Case Study: MNIST Handwritten Digits

0 0 0 0 0 0 0 0 0 0
1 1 1 1 1 1 1 1 1 1
2 2 2 2 2 2 2 2 2 2
3 3 3 3 3 3 3 3 3 3
4 4 4 4 4 4 4 4 4 4
5 5 5 5 5 5 5 5 5 5
6 6 6 6 6 6 6 6 6 6
7 7 7 7 7 7 7 7 7 7
8 8 8 8 8 8 8 8 8 8
9 9 9 9 9 9 9 9 9 9

Binarization

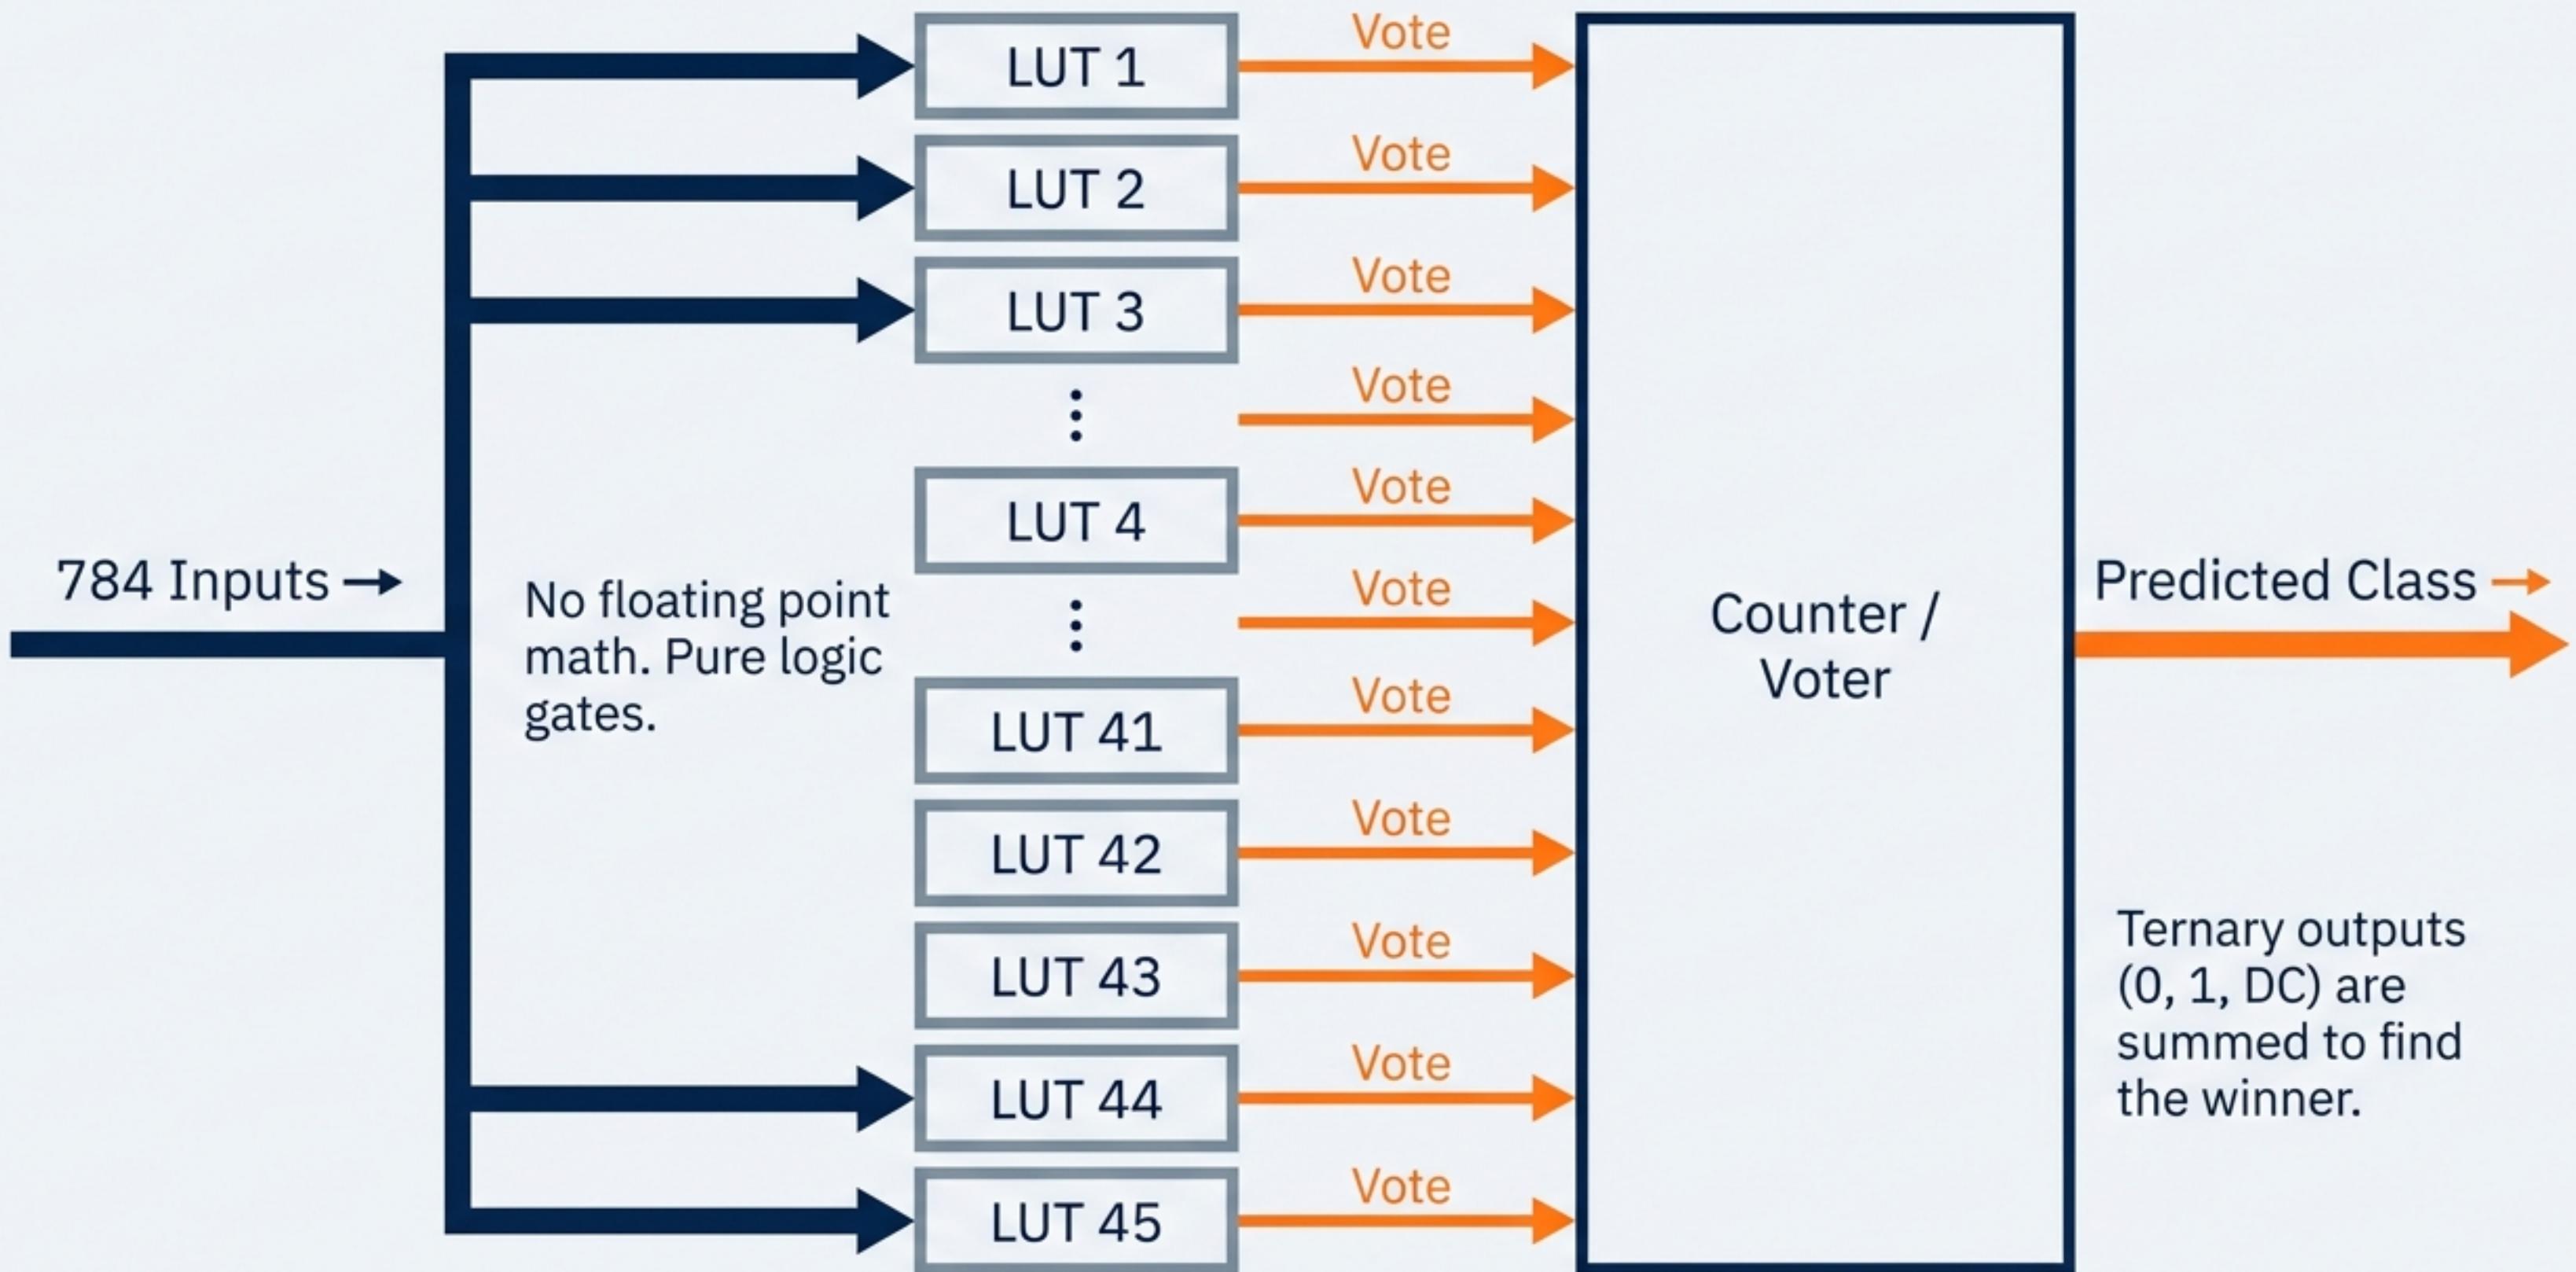

784 Boolean Variables ($x_1 \dots x_{784}$)

Variable Reduction

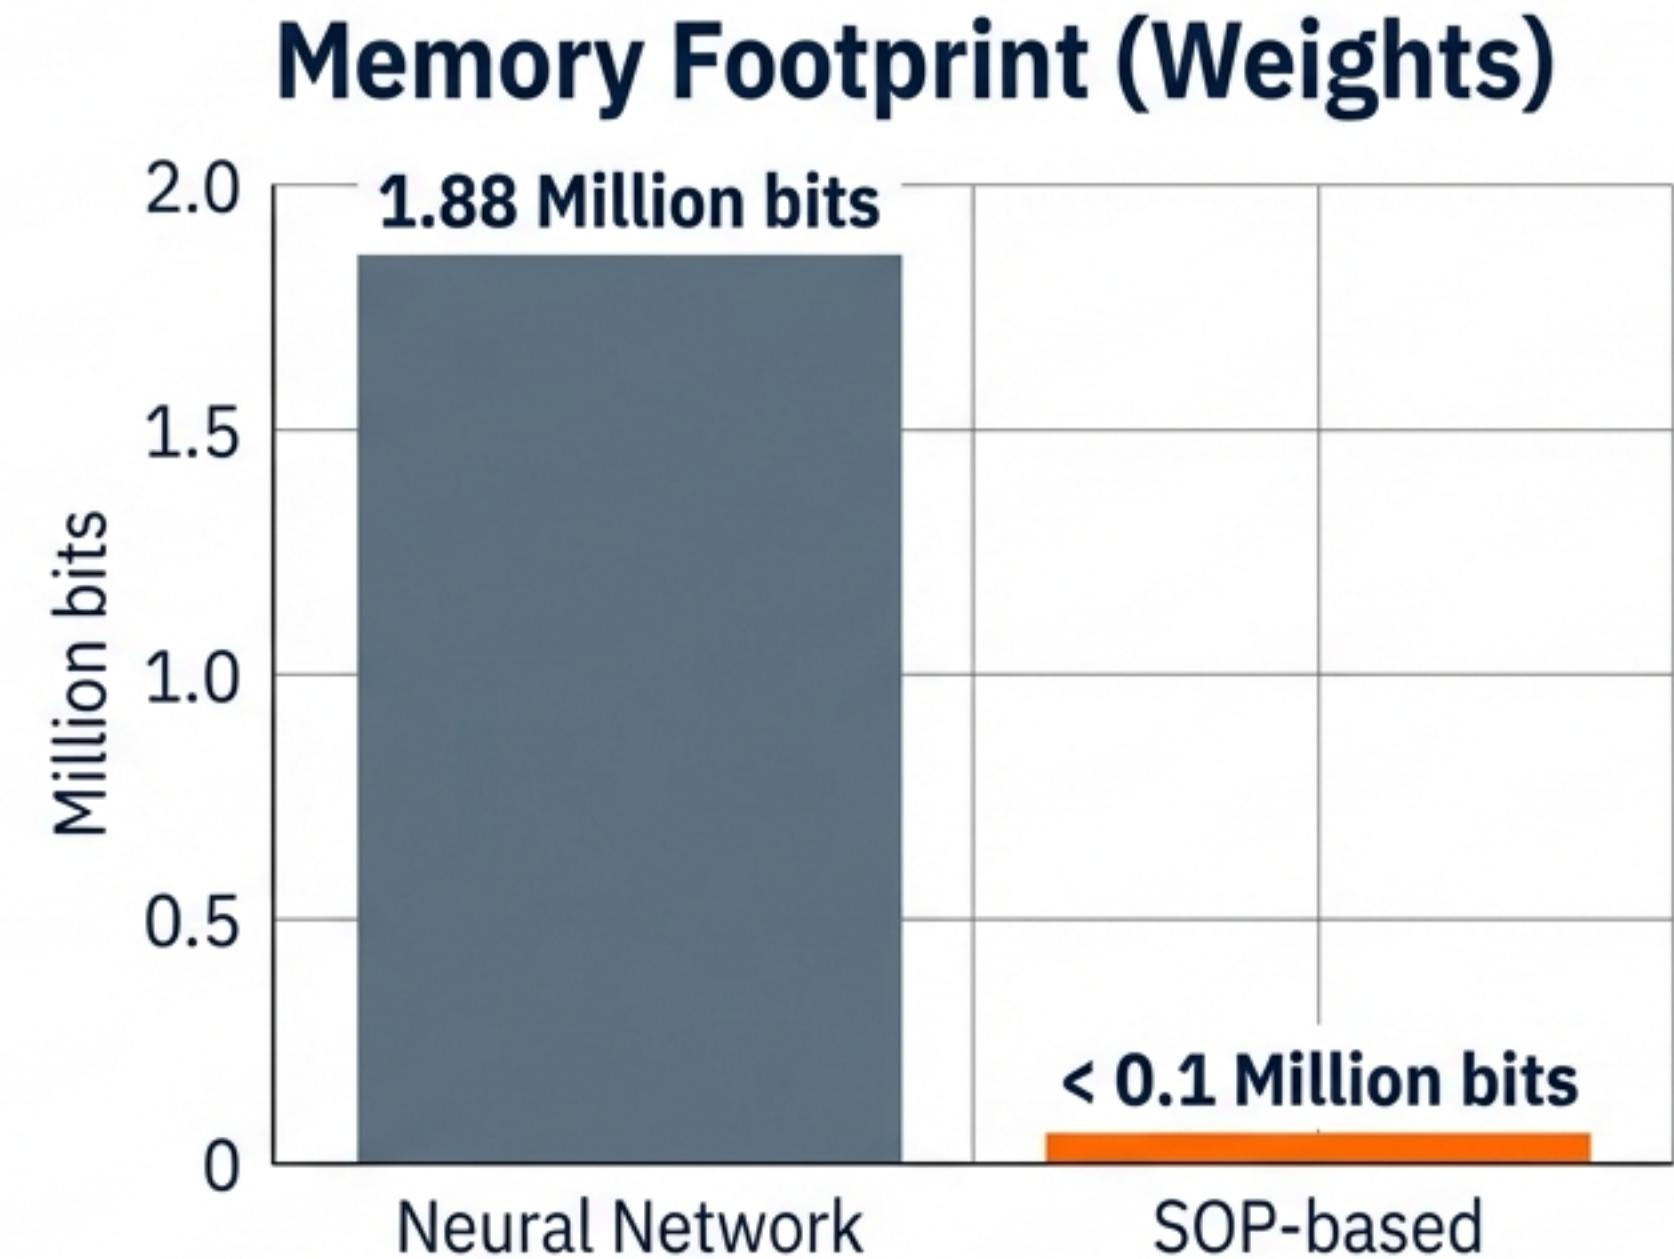

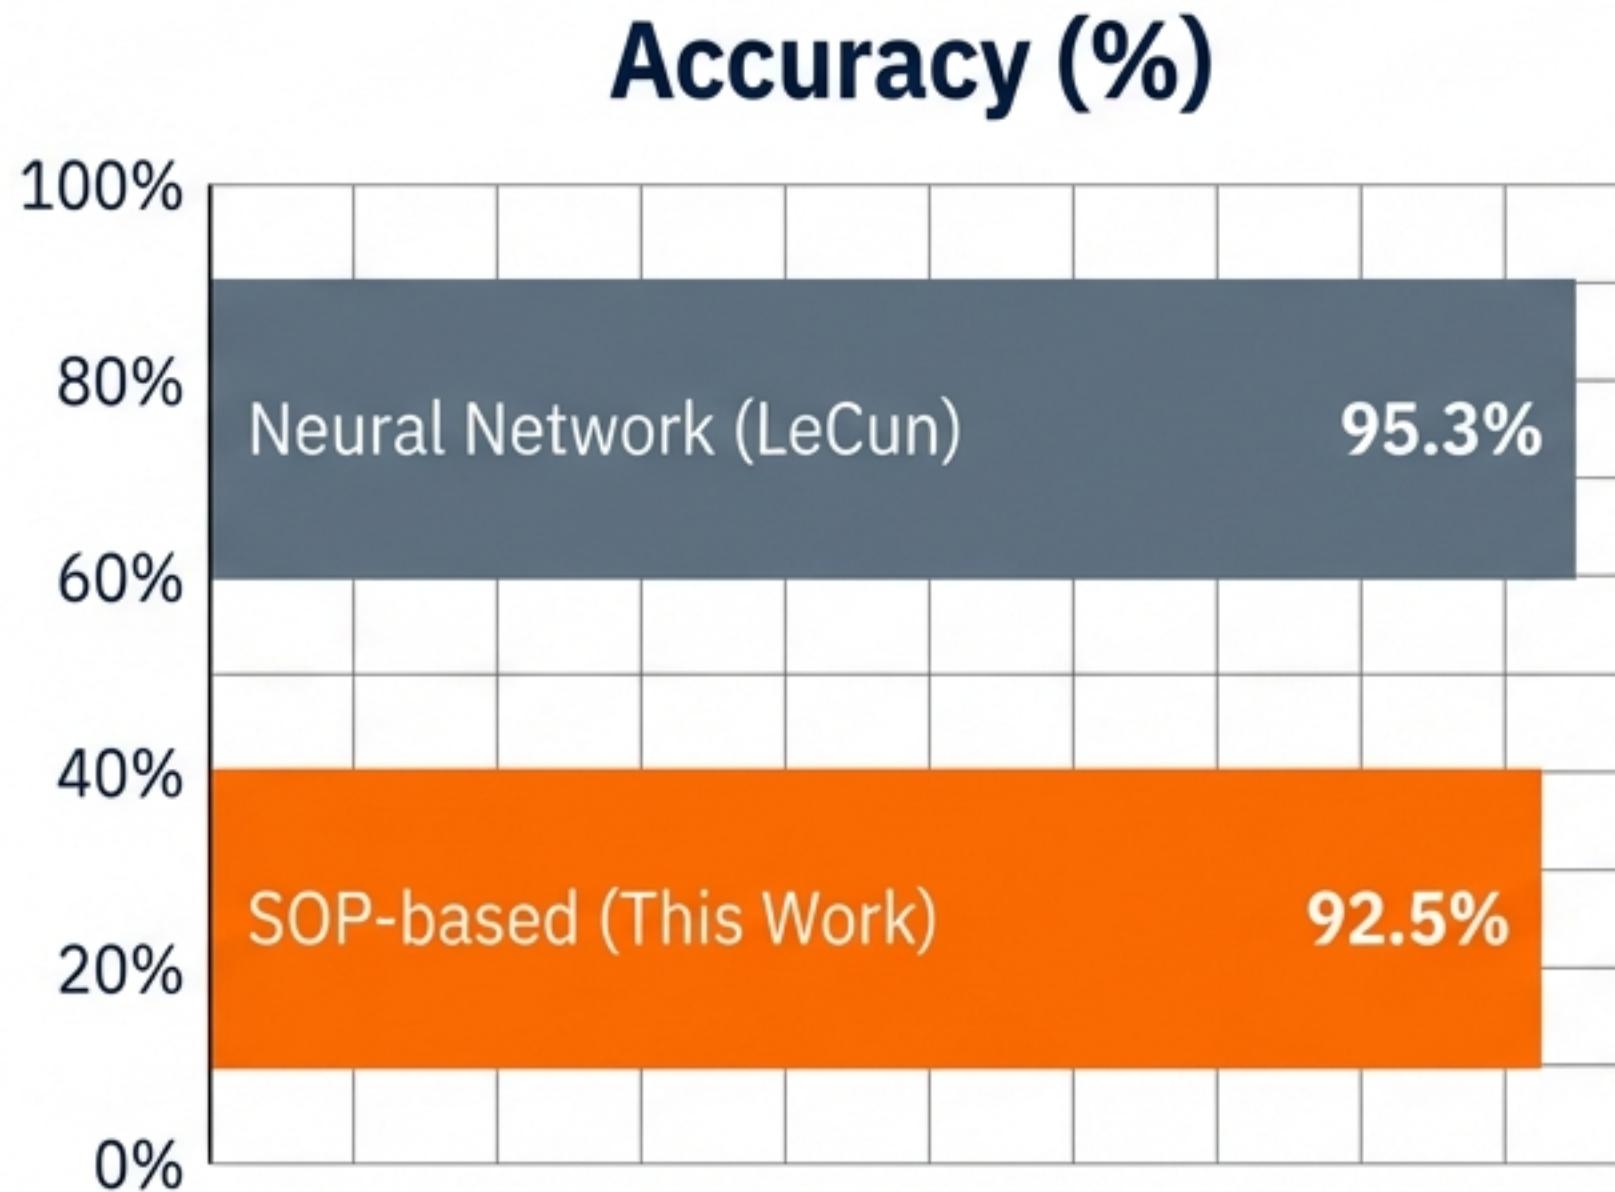

$x_{42},$
 $x_{105},$
 $x_{300},$
 $x_{300},$
 $x_{512},$
 $x_{512},$
 $x_{618},$
 $x_{678},$
 $x_{220},$
 $x_{235},$
 $x_{321},$
 $x_{328},$
 $x_{335},$
 $x_{333},$
 $x_{335},$
 $x_{401},$
 $x_{435},$
 $x_{450},$
 $x_{426},$
 $x_{378},$
 $x_{390},$
 $x_{438},$
 $x_{448},$
 $x_{452},$
 $x_{475},$
 $x_{500},$
 $x_{512},$
 $x_{521},$
 $x_{613},$
 $x_{667},$
 $x_{678}...$

Training: 60,000 images. Testing: 10,000 images.

The 45-Unit Realization Architecture

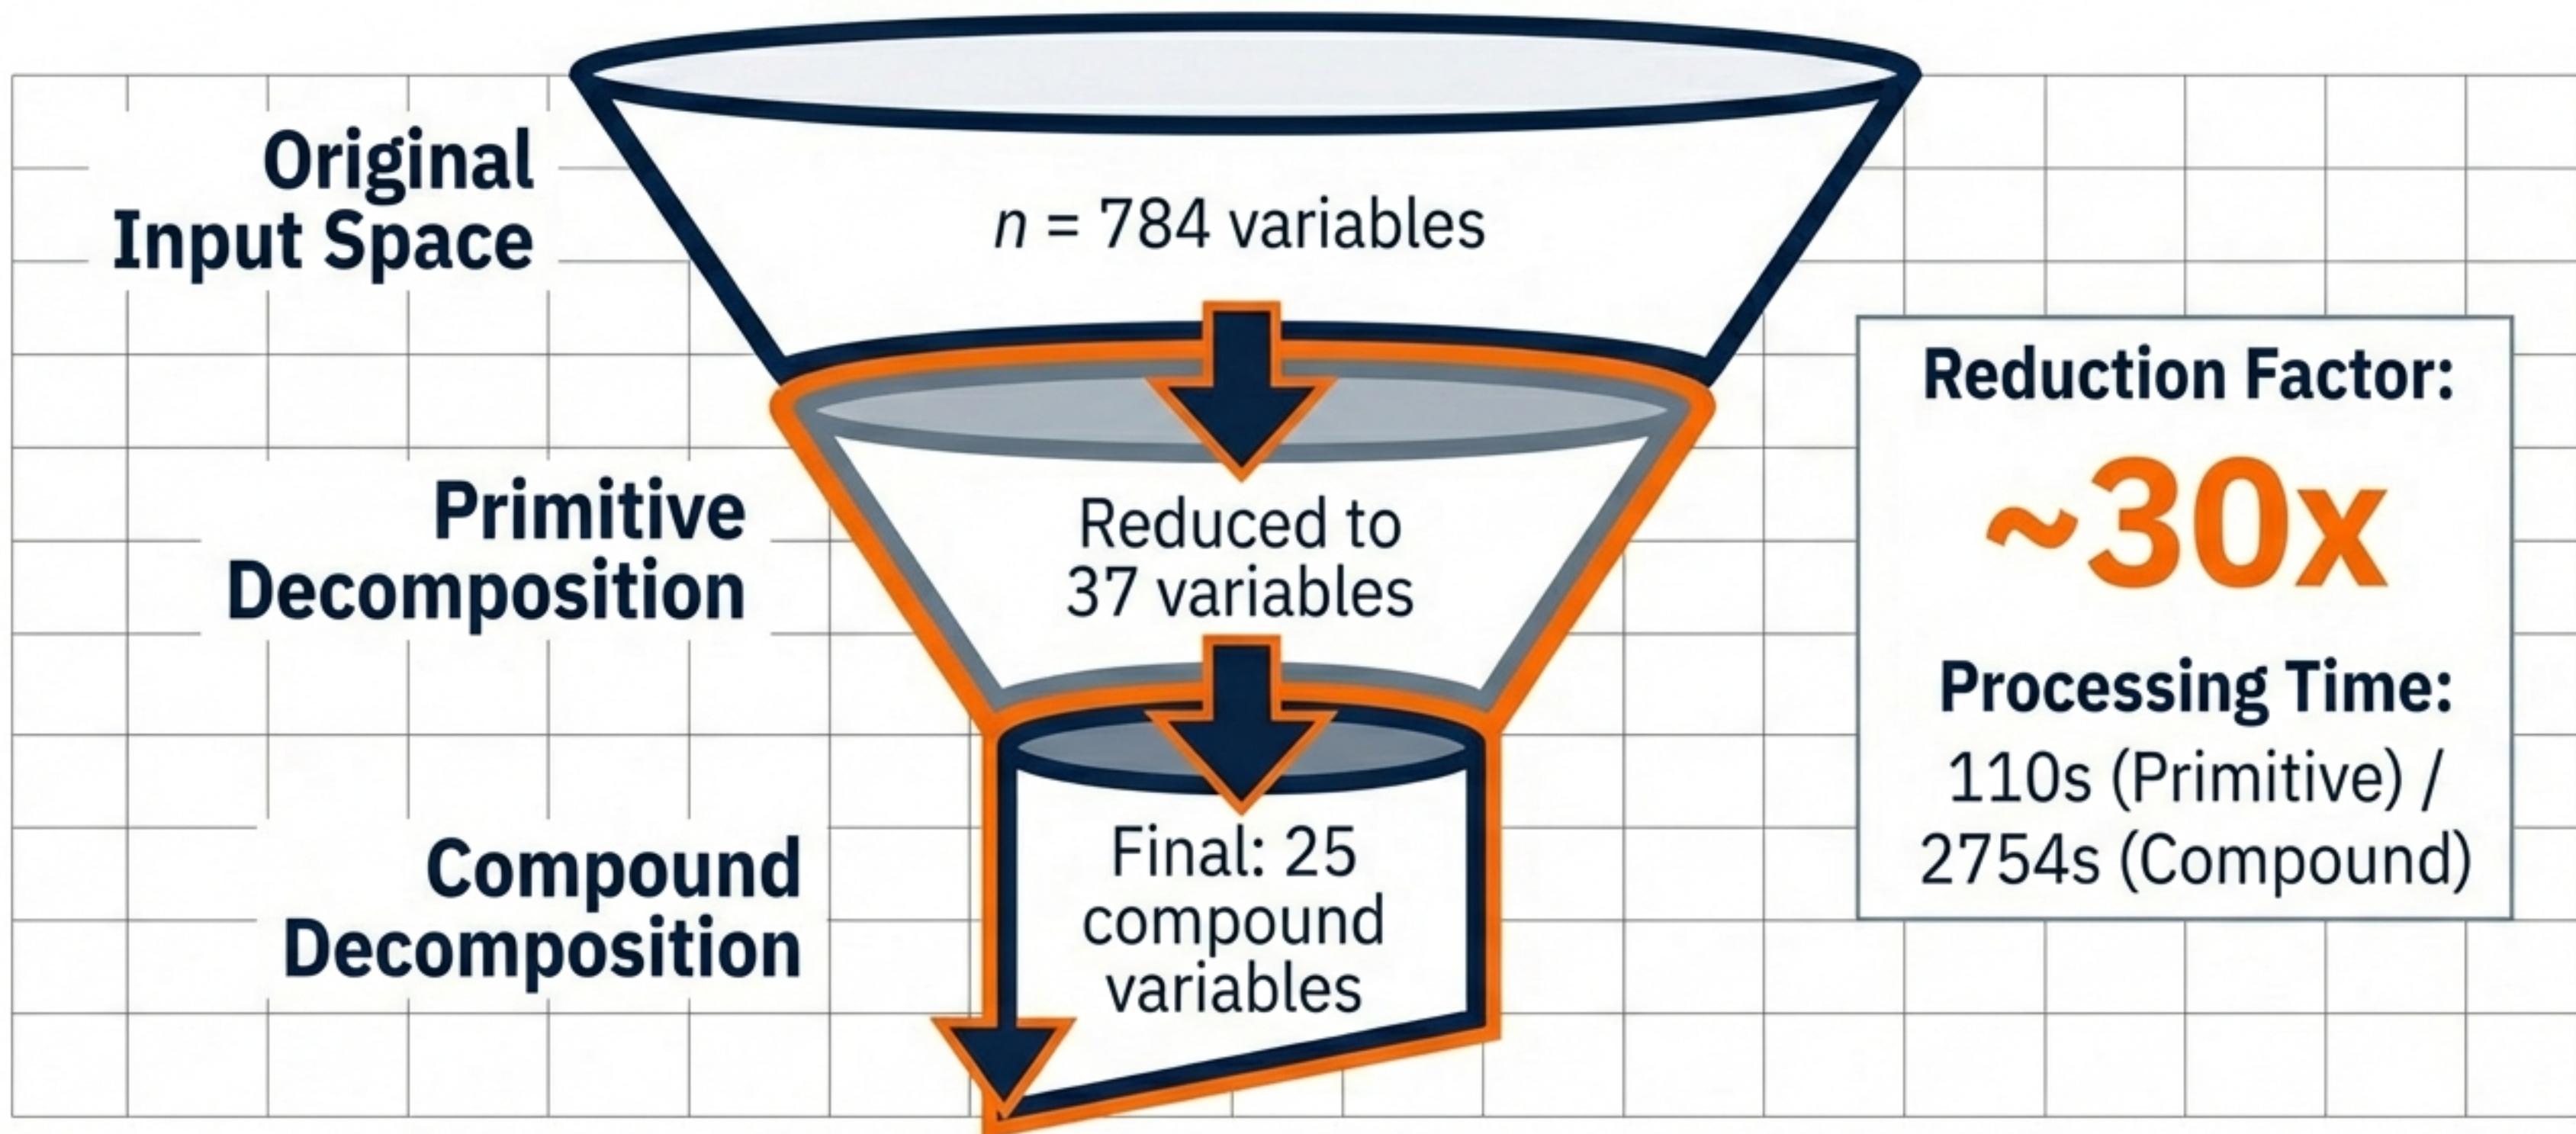

Performance Comparison: The Trade-off

Interpretability: Neural Network = Low (Black Box) | SOP = High (White Box)

Decomposing High-Dimensional Data

Future Directions & Open Problems

Continuous Variables

Developing better
discretization for
sensor/medical data.

Multi-Valued Inputs

Minimization for non-
binary (>2 state) logic
functions.

Closing the Gap

Improving ensemble
methods to reach 95%+
accuracy.

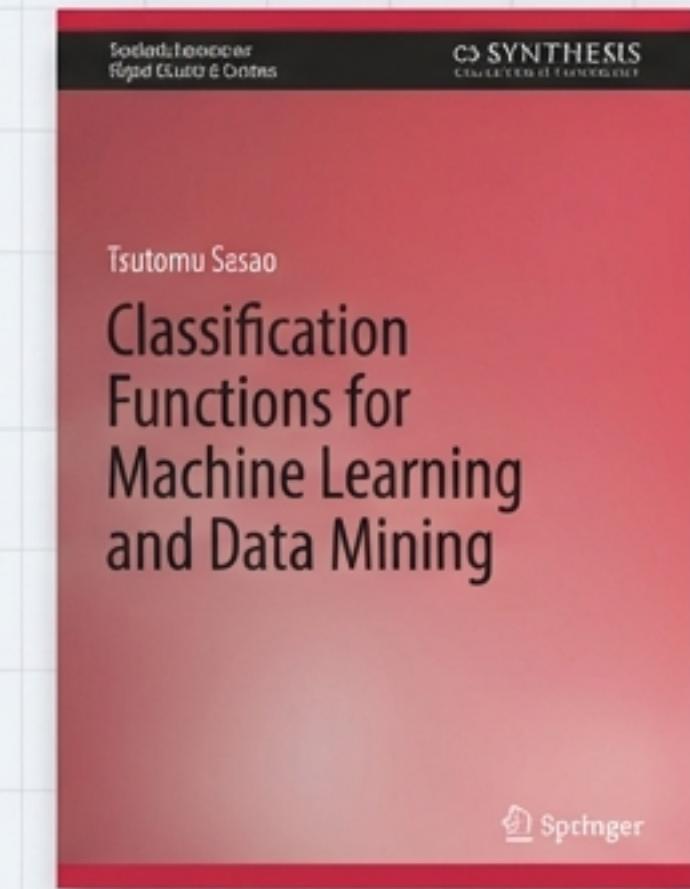

Applications

Packet classification,
Intrusion Detection,
High-Energy Physics.

Summary of Contributions

- 1. Parsimony:** Classification possible with $p \approx \log_2 k$ variables.
- 2. Transparency:** Logic synthesis yields interpretable ‘White Box’ rules.
- 3. Efficiency:** Orders of magnitude reduction in memory for FPGA/ASIC.
